Description	A stainless steel blind fastener with a self-contained stainless steel mandrel which is otherwise designed identically to other dome head rivets. The head of the body is slightly rounded and twice as wide as the diameter of the body.
Applications/ Advantages	Dome head is the only head style for stainless steel rivets. Stainless rivets have the strongest tensile strengths, shear strengths and mandrel break-load standards of all the break mandrel rivets discussed in this section. They resist tarnishing under most atmospheric conditions and offers high strength at moderately raised temperatures. They should be used when fastening materials with mechanical and physical properties similar to stainless steel.
Material	<i>Rivet:</i> 305 (or equivalent) Stainless Steel <i>Mandrel:</i> Stainless Steel (300 series)
Shear Strength	Rivets shall have ultimate shear loads not less than the minimum ultimate shear loads specified for the applicable size given in the above table.
Tensile Strength	Rivets shall have ultimate tensile loads not less than the minimum ultimate tensile loads specified for the applicable size given in the above table.
Mandrel Break Load	While the rivet is being set, the axially applied load necessary to break the mandrel shall be within the limits specified for the applicable rivet size given in the above table.

Notes on Rivet Selection

Strength - The tensile and shear strengths required for an application must be determined and a rivet selected that meets those requirements.

Materials - Choose a rivet that is made of a metal with similar mechanical and physical properties as the materials being joined. This is especially critical in assemblies where higher temperatures and/or corrosive elements are present. Metal compatibility helps reduce the risks of galvanic corrosion and material fatigue.

Grip Range - Measure the total thickness of the materials being fastened. This is known as the "rivet grip". The grip ranges of the most commonly available rivets are listed in the table below. Sufficient rivet length is necessary for proper formation of the secondary head on the blind side of the assembly. Multi-grip rivets have wider grip ranges than standard break-stem blind rivets.
